

FULL DEPTH RECLAMATION (FDR) WITH CEMENT SLURRY

EASILY TRANSFORM A:

Full Depth Reclamation (FDR) with Cement Slurry from Sagamore Ready Mix is a **DUST-FREE** process of recycling in-place worn-out asphalt and turning it into new cement treated Subbase. Cement Slurry will bond the asphalt together with the existing subbase stone and subgrade soils. The Cement treated blend is mixed with a rotary stabilizer, compacted and graded in place for use as new stabilized base. After a short curing period, the road is ready for a new surface. FDR with Cement Slurry corrects and treats failures in roads deep at their source which will create a longer lasting road or parking lot.

BEFORE
FDR with Cement

BENEFITS OF FDR WITH CEMENT

- **50 % Savings** over Remove and Replace Methods
- No purchase or hauling in new roadway base material or hauling off the old
- No wasting the original roadway investment
- **100% DUST FREE universal stabilizing agent**
- History of proven performance
- Cement Slurry works well for dust free soil stabilization and recycled bituminous pavements
- **Environmentally Friendly**
- Reduced water infiltration & Better freeze / thaw resistance

AFTER

FDR with Cement Slurry & New Pavement

CEMENT SLURRY IS THE KEY INGREDIENT which actually bonds together a composite blend of old, worn-out asphalt, subbase stone, and subgrade soils. This creates a stronger, less-permeable subgrade which contributes structurally to the new pavement section.
